What is a smart home?

A smart home refers to a convenient home setup where appliances and devices can be automatically controlled remotely from anywhere with an internet connection using a mobile or other networked device.

Types of Interface

- *System Interface:*

Smart home system basically includes sub-systems such as: Security System, Lighting System, HVAC Controlling system, Garage door system and intelligent detection system. If any of these subsystems having a problem or failed it doesn't affect the other sub-systems.

- *User Interface:*

Only a user with valid password will have the access over the controlling system of the house.

- *Hardware Interface:*

User will have the ability to control motors such as servo for opening and closing the garage door, dc motor for controlling the speed of the fan, Sensors will be controlled by the system meaning of based on some readings of these sensors the system will take some actions.

- *Software Interface:*

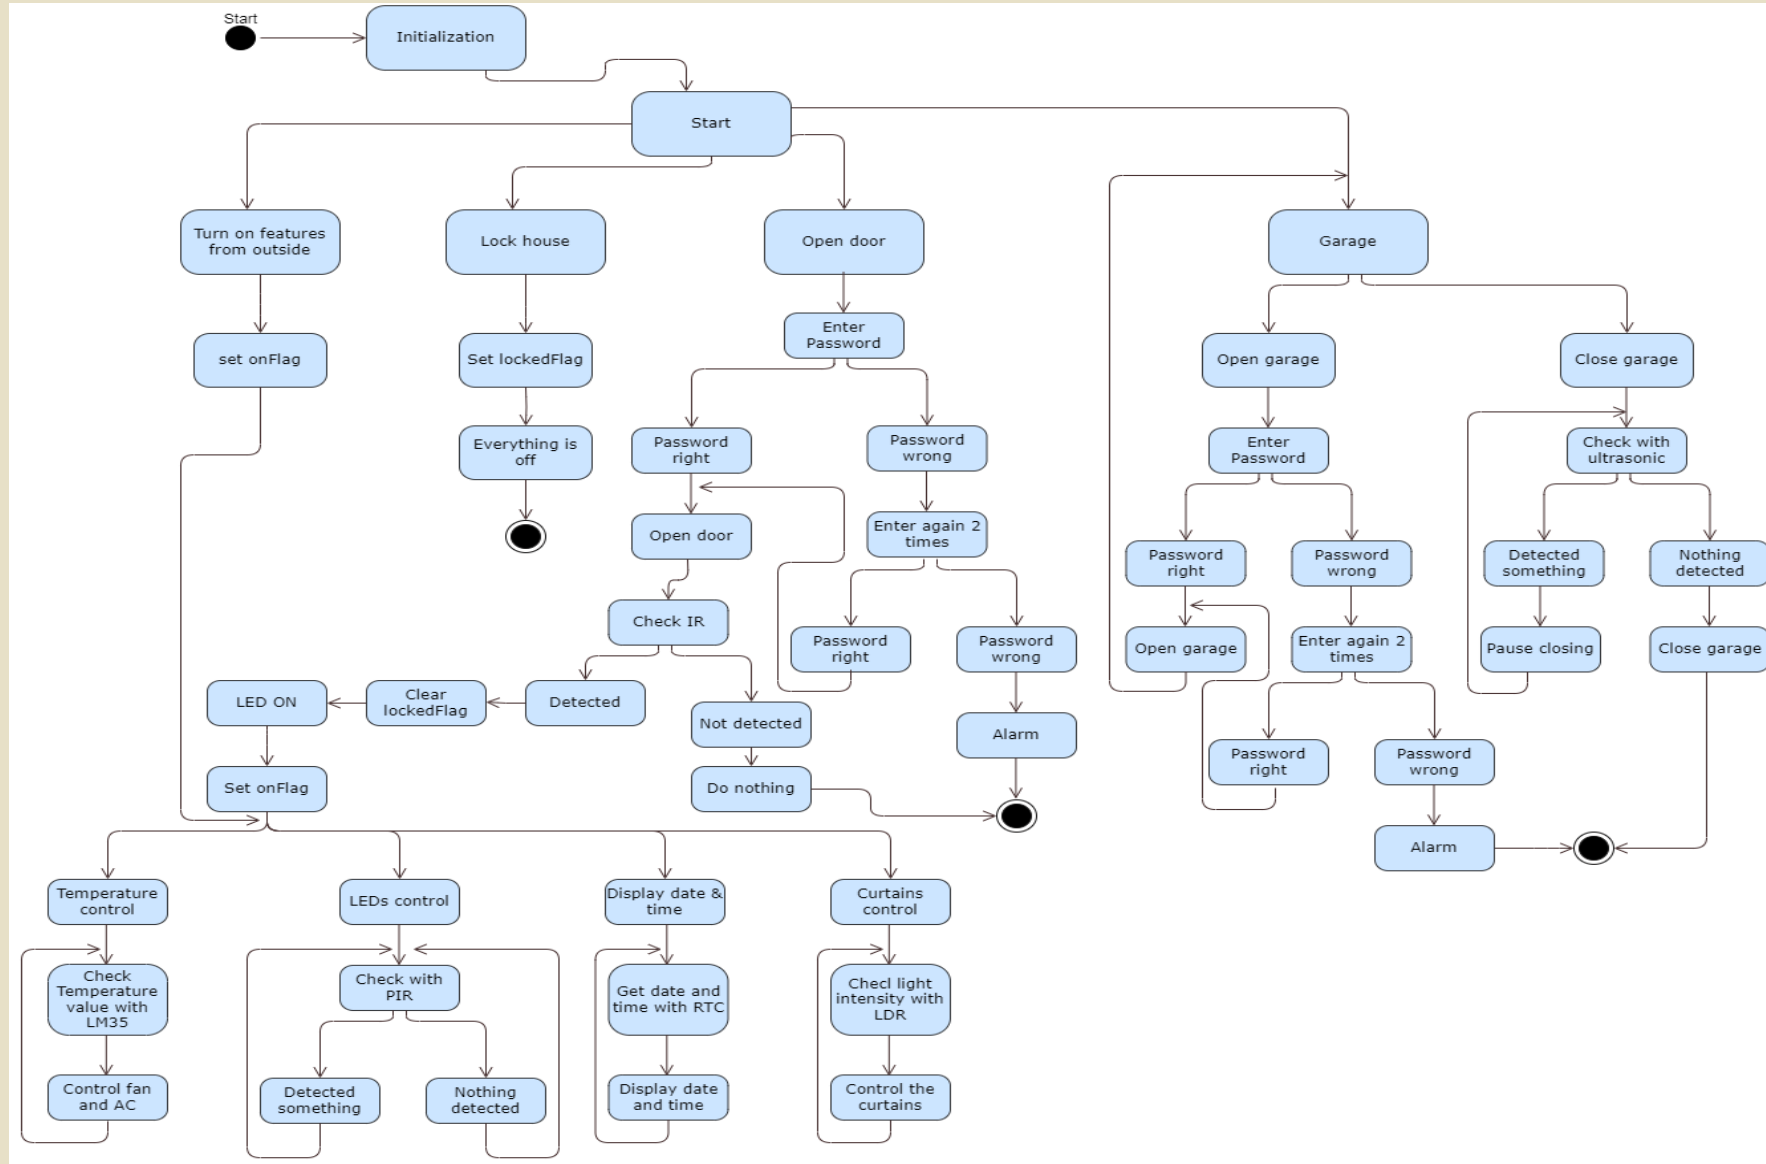

User will have the ability to control the whole home system using mobile phone application supported by the developers and the data will be displayed on LCD screen inside the house.

Customer requirement

- Open my door with a password.
- Good fire detector and fire alarm.
- Turning on and off the air conditioner based on the temperature and control it with a custom remote specific to the product.
